

## ASDIS at a glance

**ASDIS Software GmbH** offers solutions for managing the IT infrastructure in complex IT environments. These custom solutions are based on the company's own standard products. They permit the automated distribution and management of software and data in enterprise-wide IT environments when changes have to be made.

The company has almost 20 years of experience in the development of high-quality software management solutions. Customers of many years' standing such as UBS, Dresdner Bank, Deutsche Bahn (the German rail company), the Müller drugstore chain, the German Foreign Office and other prestigious companies and organizations are a testament to the reliability and efficiency of ASDIS solutions.

# Managing heterogeneous infrastructures with ease

**ASDIS Server Management is the automated software and system configuration management solution throughout the entire life cycle, offering the proven benefits of ASDIS:**

### **Centralized**

ASDIS Server Management installs and monitors entire software configurations on your server systems from a central point. Your systems thus become powerful, customized application servers. No manual administration is required on the target systems.

### **Easily integrated in other systems**

ASDIS Server Management can be easily integrated in your existing systems and handles complex, heterogeneous IT environments effortlessly.

### **Secure, reliable and transparent**

Security is ensured by a role-based user concept and protection mechanisms for data transfer. Your software is signed, encrypted and transferred to exactly the systems for which it is intended. ASDIS logs all actions. All the software management steps you take can thus be retraced and audited.

### **Platform-independent**

Available for all widely used operating systems – across all systems, platforms and versions.

### **Modular, customizable inventorying**

ASDIS inventories your hardware and software reliably based on standards. All kinds of other information can be obtained through further inventory modules – depending entirely on your requirements.

### **ASP/SaaS-ready**

Like the other ASDIS solutions, ASDIS Server Management is designed to allow application server providers and SaaS providers to work with it easily and thus broaden their portfolio. IT departments benefit from this because it facilitates planning and cost control and gives them an attractive package of services.

### **Particularly suitable for high-security systems and applications where security is critical**

When managing your servers, the ASDIS system sets up no connections from the secure zone to insecure zones. ASDIS does not use any functions with connections to the secure zone from untrusted networks. ASDIS Agent, which processes the management orders on a system, works without Java, requires only a single encrypted communication channel and utilizes virtually no system resources at all.

ASDIS thus meets the essential requirements for the operation of machines in high-security environments and offers the highest possible level of security, particularly for environments in which security is critical.

#### *Overview of the functions of ASDIS Server Management:*

- *Client/server architecture*
- *Web-based user interface for central administration*
- *Scalable, secure and reliable software management*
- *Inventorying and reporting*
- *Patch management, alerting and monitoring*
- *Initial installation and crash recovery of operating systems*
- *Available for 32- and 64-bit versions of Windows, Linux, Solaris, AIX and HP-UX*
