## The ATM/Kiosk Management – At a Glance

### Guaranteed security for demanding tasks

24/7 availability - Every minute counts in the highly competitive ATM/kiosk market. The ASDIS Software is the automation solution for total software and system configuration management of automated machine and kiosk systems, ensuring smooth and efficient operation.

### Diverse range of applications – adapted to your individual needs and wishes

Regardless of which automated machines, kiosks, or self-service systems are concerned - we will find a solution that satisfies your requirements. The ASDIS Software ensures that devices are safely kept available, updates locally held data (e.g. local advertisements), monitors and refreshes the device software and driver.

### Satisfied Customers

Our satisfied customers and references speak for themselves as well as for the flexibility and dependability of our ASDIS Software - for example, our 28% market share in ATM management of German banks, which makes us the market leader in this sector. More than 20 years experience in managing heterogeneous infrastructures offers a solid foundation for solving the most complex challenges.

### Cross-platform and centrally controlled

Central control of the ASDIS Software is available for all common operating systems: across all versions, systems and platforms. Thus, with little effort, different systems can all be managed in the same way, which in turn enables substantial cost savings.

## Reliable monitoring and modular inventorying

ASDIS reliably monitors and inventories your hardware and software based on the supported standards (WMI/XFS). The identification of any further data can be carried out by adapting the respective configuration to your specific requirements.

## ATM and service provider (SaaS)

The ASDIS Software is designed in such a way that ATM and service providers (SaaS) can work with it easily and thus broaden their portfolio. IT managers within companies can benefit from facilitated planning and cost control along with an attractive bundle of services.

## Particularly suitable for comprehensive IT structures and demanding tasks

Through its efficient management, ASDIS monitors the installed software and installs patches and updates quickly and securely. Advertising content or marketing activities can be individually and inexpensively distributed and activated, so that modifications are possible as often as desired. For diagnostics and analysis of automated machines, ASDIS publishes both journals and logs, which are available on a regular basis or per request. This guarantees that devices perform their tasks as desired, even after frequent changes:

- ✓ Available for special devices like PACKSTATIONS, MAUT-Terminals or DB-Ticket Machines
- ✓ Inventory of device-specific information and properties
- ✓ Individually adjustable
- ✓ Monitoring in compliance with existing SLAs

### Your benefit

- Utilize platform variety
- Guarantee security
- Increase availability
- Optimize processes
- Manage applications and content
- Ensure operations

## ATM/Kiosk Management functions in overview

ATM/Kiosk Management utilizes the ASDIS Software Management and ASDIS Information System components.

- ✓ Central management of the entire ATM/Kiosk system, independent of platform or manufacturer
- ✓ Software distribution: Installation, uninstallation, and configuration
- ✓ Cash management – cash level optimization
- ✓ Locally self-healing mechanisms – rebooting programs or hardware
- ✓ SSL encryption of network connections, with optional protection certificates
- ✓ Central monitoring of machine status, e.g. printer, cash cassettes, software / processes, physical changes, PIN card reader functionality, accounting journals, accounting events, disk space
- ✓ Inventory: manage hardware and software information of the devices used
- ✓ Individual process and automation possibilities
- ✓ Reduction of service costs through less „on-site service calls“
- ✓ Interfaces for transferring data to other applications
- ✓ Local and central error detection and correction
