Server Management - at a Glance

Comfortably manage heterogeneous structures from the beginning

The ASDIS Software is the automation-solution for the management of your software and system configuration over and throughout the entire lifecycle of your devices. This all comes with the proven benefits of ASDIS. Previously decentralized tasks are combined into a new overall process where the existing potential for optimization is fully exploited.

Central

From a central point, the ASDIS Software completely installs and monitors operating systems and software configurations on your server systems. The ASDIS Software enables at any time the flexible and uncomplicated adjustment of your system configurations to the current needs.

Integrates seamlessly with other systems

The ASDIS Software can be easily integrated with your existing logistic and ERP systems. It also functions smoothly in complex, heterogeneous IT environments. ASDIS combines previously isolated IT-islands into a highly automated, transparent, and effective solution.

Strong encryption and transparency

ASDIS uses proven and tested encryption mechanisms to secure software distribution. Software packets are tested for integrity using checksums before installation. ASDIS logs every action. In this way, your software management is straightforward, understandable, and of course revision-proof.

Cross-platform

ASDIS is available for a wide range of Windows, Linux, and Unix platforms. This allows different components to be combined with each other on different operating systems in any way.

Modular and expandable Inventory

ASDIS reliably takes an inventory of your hardware and software on the basis of integrated standards (e.g. WMI). Any other information can be obtained through the use of additional inventory modules – tailored to your needs and desires.

ASP/SaaS

The ASDIS Software is designed in such a way that application service-providers or SaaS-providers can work with it easily and thus broaden their portfolio. IT managers within companies can benefit from facilitated planning and targeted cost control along with an attractive bundle of services.

Particularly suited for high-security systems and system critical applications

In the management of your server, ASDIS-System builds no connection whatsoever outside of the secured zone. The ASDIS-Agent, which executes administration tasks on a system, runs without the use of Java, requires only a single encrypted communication channel, and consumes almost no system resources. Thus, ASDIS meets the essential requirements for operating machines in high-security environments.

Your benefit

- Centralize life-cycle management
- Optimize processes
- Utilize platform variety
- Expand flexibility
- Increase availability
- Guarantee security

The functions of Server Management in overview:

- ✓ Hardware configuration (e.g. RAID) and initial installation of operating systems
- ✓ Software installation and configuration
- ✓ Patch management
- ✓ Web-based interface for central administration
- ✓ Scalable and secure software management
- ✓ Inventory, report, and license management
- ✓ Alerting and monitoring availability for 32-bit as well as 64-bit versions of Windows, Linux, Solaris, AIX, and HP-UX
- ✓ Instant crash recovery
- ✓ Security based on ssl-encryption standards
- ✓ Interfaces to simplify the integration in existing systems
