## Mobile Device Management - at a Glance

### The „Mobile Revolution“ poses new challenges for IT

According to BITKOM approx. 23 million smartphones and 3.2 million tablets were sold in 2012. Never before has it been easier to access relevant information anytime, anywhere. Employees today naturally expect the ability to use their devices within the business infrastructure, regardless of whether it works with iOS, Android, BlackBerry or Windows-based devices. As a result, the spectrum of use often goes well beyond the mobile use of e-mails: Office documents are revised and sent; CRM-databases are accessed online via app and VPN-tunnel. The use of the services provided by the company are often only secured by a combination of a username and password. Emails and other business-critical information can leave the business network – quickly and unnoticed.

### Multi-layered approach

The ASDIS Software offers an integrated approach which makes it possible to: configure a large number of devices in an automated process, proactively secure the company network, and sustainably enforce company guidelines.

### Central configuration

With the ASDIS Software you can quickly create configurations for e-mails and applications as well as rules and restrictions for devices and applications.

### Rapid implementation

Quickly and easily integrate machines into the ASDIS Software: The user receives a login and installs the appropriate application (app). As a result, he automatically receives applications, configurations, and guidelines.

## Automatically recognize unauthorized access

Monitor the compliance with the established security guidelines and create automated actions which protect the business network from unauthorized access and threats from potentially dangerous apps.

## Guarantee service – The Live-Monitoring

The ASDIS Software includes live-monitoring for Blackberry and Exchange servers. Keep track of your messaging infrastructure and minimize the required time for analysis in the event of an error.

## Integration of document-management-solutions and geofencing

External disks, email, dropbox – Today, employees have many untraceable ways to move documents unnoticeably from the company network. With the ASDIS Software, you provide your employees with a tool through which important documents can also be utilized on mobile devices as securely as on a desktop PC in the local network. The SharePoint-connection allows full-versioned operation on mobile devices. With geofencing, access to highly sensitive information can be restricted to user-defined geographic borders.

## Extensive platform support

The ASDIS Software is available for the following mobile operating systems:

- ✓ iOS
- ✓ Android
- ✓ Blackberry
- ✓ Windows Mobile/CE
- ✓ SymbianOS

### Your benefit

- Utilize platform variety
- Master complexity
- Guarantee security
- Create transparency
- Guarantee service

## The functions of Mobile Device Management in overview:

- ✓ Implementation and automatic distribution of guidelines, apps, and data
- ✓ Monitoring of Blackberry-Enterprise and Exchange servers
- ✓ Monitoring & Configuration of mobile devices
- ✓ User support: Locating and remote maintenance of mobile devices
- ✓ App-based VPN-Tunnels protect sensitive data connections
- ✓ Blacklists and Whitelists
- ✓ Mobile Data Leakage Prevention
- ✓ Mobile Security Intelligence
- ✓ Remote-wipe in case of lost or theft
- ✓ Decommissioning: complete or selective deletion after an employee leaves
